RETEST INSTRUCTIONS · 2026-09-05

Eight fixes, ready to verify

Every item below was marked failing in the last test-case sheet (Sections 4–6) and has since been fixed. Follow each numbered sequence in order — the "You should see" box tells you exactly what a pass looks like. Mark Pass/Fail as you go; your progress is saved in this browser only.

SECTION 4
SLA Engine
2 test cases

SECTION 5
Mitel Telephony Flag
2 test cases

SECTION 6
Escalation Workflow
4 test cases

SEC 04 SLA Engine

The pause/resume logic on the backend was already correct. The bug was the on-screen countdown, which recomputed live from the wall clock and ignored the pause entirely.

- **Root cause:** the ticket page's "Live SLA countdown" recalculated `due − now` every second regardless of hold status. Fixed to freeze on the backend's own paused value instead.

SE-04 Pause on Hold

Pass Fail

1. Open Administration → SLA Management → SLA Configurations. Find or create a rule and confirm its **“Pause on Hold”** toggle is on. Save.
2. Go to Tickets → Create Ticket and create a new ticket in that same Department + Priority.
3. Open the new ticket. Note the SLA time remaining shown (e.g. `3h 58m`).
4. Change the ticket's status to **On Hold** and save.
5. Watch the countdown for 1–2 minutes without touching anything else.

YOU SHOULD SEE The number freezes completely and now reads … `(paused)` — e.g. `3h 56m (paused)`.

BEFORE
Kept counting down as if On Hold did nothing.

AFTER
Freezes immediately and labels itself paused.

SE-05 Resume after Hold

Pass Fail

1. Continue from SE-04 — the ticket is still On Hold, showing its frozen … `(paused)` value.
2. Note that exact frozen value (e.g. `3h 56m`).
3. Change the ticket's status back to **Open** and save.

YOU SHOULD SEE The countdown resumes live-ticking from roughly the same number it was frozen at — not a jump back up to the full original duration, and the `(paused)` label is gone.

SEC 05

Mitel Telephony Flag

Flipping TELEPHONY_ENABLED now pushes to every open agent tab over a live WebSocket connection, instead of that tab having to poll or be refreshed.

- **Root cause:** the app's real-time server (Reverb) wasn't running at all — every WebSocket connection was failing. It's now running persistently, and the toggle broadcasts a change event over it the instant an admin flips it.

MI-04 Takes effect without a restart

Pass Fail

1. Open the agent workspace in one browser tab. Leave it sitting idle on any page — don't touch it.
2. In a **separate** tab, sign in as Admin and go to Administration → System → Mitel Configuration.
3. Flip the telephony toggle (on → off, or off → on).
4. Switch back to the agent tab — just click into it, do **not** reload the page.

YOU SHOULD SEE The voice call controls in the agent tab show or hide within about a second of switching back — no refresh needed, no waiting.

BEFORE
Needed a hard refresh to pick up the change at all.

AFTER
Updates live, near-instantly, in the background tab.

MI-05 No collateral impact on other channels

Pass Fail

1. With the flag **on**, open a chat interaction and run it end-to-end (receive, reply, close).
2. Do the same for an email interaction.

YOU SHOULD SEE Chat and email behave exactly as they always have — nothing about them changes because of the voice flag.

This row has no prior result recorded — it was never actually tested, not confirmed broken. No code changes touch chat/email, so this is a verification pass rather than a retest.

SEC 06

Escalation Workflow

Auto-escalation now reaches someone even when the ticket's own department has no supervisor assigned, and the notification it sends links to the correct page.

- **Root cause:** only one active supervisor exists system-wide, and auto-escalation only ever matched a supervisor in the ticket's *exact* department — so breached tickets outside that one department silently escalated to no one. Fixed with a fallback to any active supervisor. Along the way, also found and fixed a broken notification link that pointed at a page that doesn't exist.

EW-05 Auto-escalation fires on breach

Pass Fail

1. Go to Administration → SLA Management → SLA Configurations. Create or edit a rule: **Duration = 2 min** (for a fast test), **Escalation Threshold = 50%**, **Auto Escalate = on**, **Active = on**. Note its Department + Priority.
2. Create a new ticket in that same Department + Priority. Leave it unresolved.
3. Wait for the SLA check to run — it runs automatically every 15 minutes. (Ask engineering if you'd like it triggered immediately instead of waiting.)
4. Reopen the ticket and check its **Escalation** section.

YOU SHOULD SEE A new escalation with status `pending` — created with no manual action from you.

EW-06 Auto-escalation targets correctly

Pass Fail

1. Using the escalation created in EW-05, open it and note the target agent shown.
2. Check that agent's role is **Supervisor** and confirm the escalation **Level** is one of `L1` / `L2` / `Supervisor` / `Manager`.

YOU SHOULD SEE A real, active supervisor as the target with a valid level. If nobody holds Supervisor in the ticket's own department, the target will be a different active supervisor instead — that's the intended fallback, not a bug (see EW-07).

EW-07 No supervisor assigned

Pass Fail

1. Repeat the EW-05 setup, but pick a Department that currently has **zero** users holding the Supervisor role.
2. Wait for the same auto-escalation to fire (or have engineering trigger it).

YOU SHOULD SEE An escalation is still created, routed to another active supervisor — no error, and no ticket silently left with nobody assigned.

BEFORE
Escalation to the wrong department could happen without a clear fallback reason, or nothing was created at all for an unmatched department.

AFTER
Falls back to any active supervisor on purpose, logged as a fallback.

EW-08 Escalation visible to the target

Pass Fail

1. Log in as the supervisor who received the escalation from EW-05 (without being told which ticket it's on).
2. Click the notification bell in the top header.
3. Find the "Ticket … escalated to you" entry and click it.

YOU SHOULD SEE The escalation appears in the bell menu on its own, and clicking it opens the correct ticket directly.

BEFORE
Clicking the notification led to a broken/blank page.

AFTER
Opens the exact ticket the escalation is about.
